

RedSeal Cloud

Stop unintended exposure

The complexity of cloud computing increases security risks

According to Gartner, through 2025, at least 99% of cloud security failures will be the customer's fault.

Cloud security is complex and distributed. In organizations with on-premise environments, the controls sit with the network security team who are responsible for the firewalls. In the cloud, security controls sit with multiple DevOps teams, Kubernetes policies, third parties and inside AWS and Azure natively. Cloud security controls may not be implemented by security teams but by numerous application developers. The impact is an exponential growth in misconfigurations that are leaving resources unintentionally exposed to the internet.

Cloud security challenges have become so prevalent that Gartner has defined Cloud Security Posture Management (CSPM) as a new category of security products designed to identify misconfiguration issues and risks in the cloud. CSPM solutions are typically used by security organizations that want the equivalent visibility and security that they've had with on-premise environments.

Furthermore, today's cloud-native applications are built on services that are based on containers orchestrated with Kubernetes. For example, Amazon's managed service for running Kubernetes is Elastic Kubernetes Service (EKS), but users can create security controls to protect their EKS clusters.

RedSeal's new SaaS-based CSPM solution

RedSeal Cloud tells you what resources you have in your cloud and if they are exposed to the internet, and accurately brings all your AWS and Azure network infrastructure into a single comprehensive visualization.

What can help security teams better manage this increased risk?

- Complete and up-to-date visualization of their cloud infrastructure
- Detailed knowledge of Kubernetes resources and policies
- Identify which resources are exposed to the internet—and how

Identify exposure to the internet

Visualize your AWS and Azure cloud connectivity

Understand your Kubernetes and cloud inventory

Immediately identify exposure to the internet

Several of the largest data breaches occurred when cloud misconfigurations left critical resources exposed to untrusted networks. RedSeal Cloud provides much greater detail than tools provided by native CSPs, enabling security teams with a built-in report of all resources exposed to the internet, pre-calculated and grouped by tags.

Tags are fundamental in cloud environments because they enable you to categorize your resources with different labels, such as purpose, owner, or environment. These are important when you have multiple resources of the same type—you can quickly identify specific resources based on the tags that you've assigned.

Cloud Real Exposure

RESOURCE NAME	RESOURCE ID	DESTINATION IP	SECURITY GROUP/RSG	TAGS	ACCOUNT/SUBSCRIPTION	VENDOR	VPC/VNET	EXPOSURE DETAILS
...	...	192.168.84.34, 78...	sg-4b0c0a0f/us-east-1, sg-80918b47/us-east-1	14	redund...	AWS	us-east-1	Yes
App V1-F20v	jsdbcmprnps/...	172.28.4.4	...	0	RedSeal Azure Subscription...	Microsoft Azure	VNET2	Yes
...	jsdbcmprnps/...	10.1.0.1, 10.1.0.2	sg-4b0c0a0f/us-east-1, sg-80918b47/us-east-1	1	redund...	AWS	vpc-2	Yes
VM11	jsdbcmprnps/...	10.1.1.5	...	0	RedSeal Azure Subscription...	Microsoft Azure	VNET1	Yes
VM12	jsdbcmprnps/...	10.1.1.4	...	0	RedSeal Azure Subscription...	Microsoft Azure	VNET1	Yes
...	...	10.1.0.30	sg-4b0c0a0f/us-east-1	1	engineer@p...	AWS	Tenable_VPC	Yes

RedSeal Cloud provides:

- Out-of-the-box overview of internet exposed resources by tags
- Drill down capabilities to identify exact security controls in cloud accounts, VPCs, NACLs, and security groups
- Key information to inform your remediation options, from security groups to specific identification of ports/protocols controlling the access that may be allowing exposure

Visualize your AWS and Azure Cloud architecture with maps and inventory

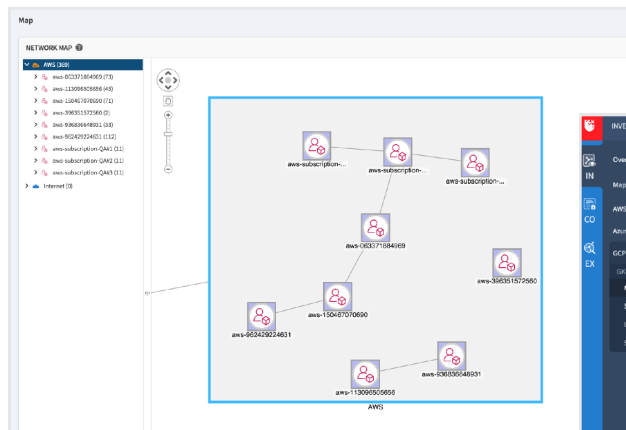

After addressing unintended exposure, security teams also need to understand the connectivity between and within cloud resources. Native CSP tools provide basic capabilities to monitor and secure cloud environments, which may be sufficient for smaller, cloud-first companies. However, teams at larger enterprises are being asked to secure huge cloud environments and benefit from a visual, interactive model of their organization's cloud resources.

RedSeal Cloud enables security teams to:

- View a map of all AWS accounts, Azure subscriptions, VPCs, VNETs, gateways, and subnets
- Visualize the connections between and within your AWS and Azure resources
- View your AWS and Azure inventory and drill down into details in milliseconds

Other security products may show you connectivity where there is traffic, using an agent-based approach, but only RedSeal Cloud can show you all connectivity possible—including those without traffic—using an agentless approach.

Maps and inventory

Examine your Kubernetes (EKS, AKS, and GKE) inventory

According to AWS, a majority of organizations have experienced container security incidents. Securing EKS clusters starts with understanding your inventory, determining if you have overly permissive accounts, and identifying if you have services unintentionally residing outside of your defined clusters.

With RedSeal Cloud you can go beyond the native tools available in your CSP to:

- View and search EKS inventory, and drill down into each resource, including namespace, pods, services, and clusters
- Identify overly permissive user and service accounts
- Quickly identify how services can access a cluster

See through the cloud complexity

RedSeal Cloud is a security solution for the modern day that provides security teams with a unified, interactive view of their AWS and Azure environments, EKS, AKS, and GKE inventory, and exposed resources that can lead to costly data breaches.

Kubernetes inventory

RESOURCE NAME	KIND	NAMESPACE	CLUSTER	LOCATION
application-controller-manager-0	Pod	application-system	ye-eks	us-central1
application-controller-manager-1	Pod	application-system	ye-eks	us-central1
application-controller-manager-service	Service	application-system	ye-eks	us-central1
application-system	Namespace		ye-eks	us-central1
cert-manager	Service	cert-manager	ye-eks	us-central1
cert-manager	Namespace		ye-eks	us-central1

Details
<p>Namespace: cert-manager</p> <p>Created: 2020-12-07 18:15:17</p> <p>Cluster Name: ye-eks</p> <p>Location: us-central1</p>

About RedSeal. RedSeal delivers actionable insights to close defensive gaps across the entire network, on premises and in the cloud. Hundreds of Fortune 1000 companies and over 75 government agencies, including five branches of the U.S. military, depend on RedSeal for exceptionally secure environments.
